ARTHUR B. EPSTEIN, O.D. F.A.A.O.
JOSEPH M. FREEDMAN, O.D.

I have reviewed certain information with regard to the above case, which serves as the bases and reasons for the opinions and facts that I would testify to. I would also base my testimony on my education and experience in the field of optometry, my experience in treating optometric patients over a period of 28 years and the research that I have engaged in over the past 25 years, that has in part resulted in various publications that I have authored. My experience, education and publications are listed in my curriculum vitae.

The information that I reviewed includes:

1. Transcripts of the depositions of Judith and George Thibeu;
2. Transcript of the deposition of Dr. John Pietrantonio;
3. Vision Center protocol regarding dilation exams;
4. Judith Thibeu's treatment records from the eye clinic, including the records from 9/26/02;
5. Defendant United States' Answers to Interrogatories.

I have been paid approximately \$1500 for my review and study of this case which has resulted in the opinions set forth in this report. Furthermore, if called to testify at trial, I will charge \$3,500 as compensation for the time necessary for such testimony [assuming one half day of testimony.]

1. Dilating eye drops usually cause loss of contrast sensitivity, decreased depth perception, blurry vision, glare, sensitivity to light and disorientation.
2. Warnings regarding the effects of dilation should be given prior to the application of dilating drops.
3. If evidence confirms that warnings were not given as to the effects of dilation that would be a breach of the accepted standards of care.
4. On the date of the accident Ms. Thibeu was suffering from a unilateral dense cataract. The presence of this condition can reduce contrast sensitivity and interfere with depth perception. The dilation of her eyes on 9/26/02 likely caused additional loss of contrast sensitivity, decreased depth perception, blurry vision, glare, sensitivity to light and disorientation. In combination, the effects of the cataract and dilation caused Ms. Thibeu to suffer a greater increase in loss of contrast sensitivity, loss of depth perception and disorientation than would be expected from the standard effects of dilation.

JOSEPH M. FREEMAN, O.D., F.A.A.O.

5. Considering Ms. Thibeu's existing diminished vision (due to her cataract) as she entered the eye clinic on 9/26/02, it would have been logical and prudent for the examining optometrist to consider the particular problems with Ms. Thibeu's vision and the combined effects of dilation and unilateral dense cataract in determining her need to be warned regarding the effects of dilation.

6. The eye clinic and the examining optometrist probably should have considered that the stairs posed a risk to all patients, including Ms. Thibeu, who had been dilated; and either posted warning signs or given verbal warning to all patients, or notified them of the existence of an elevator and suggested that they use the elevator rather than take the stairs.
